

解方程

$$\frac{dy}{dx} = \frac{1 + xy^3}{1 + x^3y}$$

$$(1 + xy^3)dx + (1 + x^3y)dy = 0$$

令 $u = x + y, v = xy$

关键在于 $du = dx + dy, dv = xdy + ydx$

一个关键的等式：

$$d\left(\frac{u}{v}\right) = -\frac{1}{x^2}dx - \frac{1}{y^2}dy$$

$$-v^2 d\left(\frac{u}{v}\right) = x^2 dy + y^2 dx$$

所以

$$du - uv^2 d\left(\frac{u}{v}\right) = 0$$

$$(1 - uv)du + u^2 dv = 0$$

$$\frac{dv}{du} - \frac{v}{u} = -\frac{1}{u^2}$$

$$u \frac{d\frac{v}{u}}{du} = -\frac{1}{u^2}$$

$$v = \frac{1}{2u} + Cu$$

$$xy(x + y) = \frac{1}{2} + C(x + y)^2$$
