

解方程

$$\frac{dy}{dx} = \frac{y}{x - \sqrt{xy}}$$

$$\frac{dx}{dy} = \frac{x}{y} - \sqrt{\frac{x}{y}}$$

$$\text{令 } s = \frac{x}{y}, t = xy$$

$$\sqrt{\frac{t}{s}}ds + \sqrt{\frac{s}{t}}dt = (s - \sqrt{s})\left(\frac{dt}{\sqrt{st}} - \frac{1}{s}\sqrt{\frac{t}{s}}ds\right)$$

$$(2\sqrt{\frac{t}{s}} - \sqrt{\frac{s}{t}})ds = -\frac{1}{\sqrt{t}}dt$$

$$(2\sqrt{st} - t)ds = -sdt$$

$$\frac{2\sqrt{s} - 1}{s}ds = -\frac{dt}{t}$$

$$xe^{-4\sqrt{\frac{x}{y}}} = Cxy^2$$
